Students need to master various techniques, calculating Net Present Value (NPV), Internal Rate of Return (IRR), and Payback Period, and understanding their limitations. Emile Woolf excels in presenting these techniques clearly, often using visual aids and real-life business case studies to solidify understanding. |

Investment Appraisal Technique | Calculation | Strengths | Weaknesses | ||||| | Net Present Value (NPV) | Sum of present values of cash flows – initial investment | Considers time value of money, provides absolute measure of profitability | Requires accurate cash flow forecasting, sensitive to discount rate | | Internal Rate of Return (IRR) | Discount rate that makes NPV zero | Easy to understand and compare projects, considers time value of money | Can yield multiple solutions for complex projects, ignores project scale | | Payback Period | Time taken to recoup initial investment | Simple to calculate, focuses on liquidity | Ignores cash flows beyond payback period, ignores time value of money | Consider a scenario where a company is considering two mutually exclusive projects, A and B. Project A has an NPV of £10,000 and an IRR of 15%, while Project B has an NPV of £12,000 and an IRR of 12%. Based solely on NPV, Project B is superior.
