It's essential to identify which certification aligns with your career goals and preparation level. Always refer to the official Qlik certification website for the most up-to-date exam objectives and study materials.

Common QlikView Certification Question Categories and Examples

The QlikView certification exams are typically multiple-choice, scenario-based, or require you to select the best option. While specific questions are confidential, we can categorize the types of topics you'll encounter and provide illustrative examples to help you understand the expected knowledge depth.

1. Data Modeling and Associations

This is arguably the most fundamental aspect of QlikView. A well-designed data model is the backbone of any performant and accurate QlikView application. Expect questions that test your understanding of star schemas, snowflake schemas, and how QlikView handles data associations.

Key Concepts:

1. **Joins vs. Concatenations:** Understanding when to use `JOIN`, `LEFT JOIN`, `RIGHT JOIN`, `FULL OUTER JOIN`, and `CONCATENATE` in your scripts.
2. **Synthetic Keys:** How they are formed, why they are problematic, and how to resolve them (e.g., using `QUALIFY`/`UNQUALIFY`, composite keys, or bridge tables).
3. **Data Granularity:** Ensuring your fact tables are at the lowest possible grain and dimension tables support this.
4. **Fact and Dimension Tables:** Identifying the roles of each and how they relate.

Example Scenario:

You have two tables: 'Sales' with columns `SaleID`, `ProductID`, `CustomerID`, `SaleAmount` and 'Products' with columns `ProductID`, `ProductName`, `Category`. You need to load both into QlikView and allow users to analyze sales by product name and category. Which of the following script statements would correctly load and associate these tables?

1. `LOAD * FROM Sales.csv; LOAD * FROM Products.csv;`

2. `LEFT JOIN (Sales) LOAD ProductID, ProductName, Category FROM Products.csv;`
3. `LOAD * FROM Sales.csv; LOAD * RESIDENT Sales; LOAD ProductName, Category FROM Products.csv;`
4. `LOAD SaleID, ProductID, CustomerID, SaleAmount FROM Sales.csv; LOAD ProductID, ProductName, Category FROM Products.csv;`

Answer & Explanation: The correct answer is **4**. QlikView automatically creates associations based on common field names. Loading both tables with their respective `ProductID` columns will establish the link between them. Option 2 uses a `LEFT JOIN` which might be appropriate in some cases but isn't the simplest or most direct way to establish an association for analysis. Option 1 and 3 have logical flaws in how they would establish relationships.

2. QlikView Scripting (QVD and ETL)

The QlikView Script Editor is where the magic happens. Mastering data loading, transformation, and the use of QVD (QlikView Data) files is paramount.

Key Concepts:

1. **QVD Files:** Their purpose (fast reloads, efficient storage), how to create and load them (`LOAD ... FROM ... .qvd`, `STORE ... INTO ... .qvd`).
2. **Incremental Loads:** Strategies for loading only new or changed data to optimize reload times. This often involves date fields, flags, and `WHERE` clauses.
3. **Data Transformations:** Using `RENAME FIELD`, `DROP FIELD`, `PURGE FIELD`, `AUTONUMERIC`, `SET` and `LET` statements for variables, `IF` conditions, `LOOP` structures.
4. **ETL (Extract, Transform, Load):** The entire process of getting data from source systems into QlikView in a usable format.

Example Scenario:

You have a large transaction log file (`Transactions.csv`) that is updated daily. To speed up your QlikView application reloads, you decide to store the data in a QVD file. You want to perform an incremental load where only records with a `LoadDate` greater than the last loaded date are added. Which script logic best supports this?

1. Create `Transactions.qvd` once. Then, daily, `LOAD * FROM Transactions.qvd; LOAD * FROM Transactions.csv WHERE LoadDate > Max(LoadDate);`
2. Create `Transactions.qvd` once. Then, daily, `LOAD * FROM Transactions.csv; STORE * INTO Transactions.qvd;`
3. Create `Transactions.qvd` once. Then, daily, `Transactions_temp: LOAD * FROM Transactions.csv; Transactions_final: LOAD * FROM Transactions.qvd WHERE NOT Exists(LoadDate); CONCATENATE (Transactions_final) LOAD * FROM Transactions_temp; STORE * INTO Transactions.qvd;`
4. Create `Transactions.qvd` once. Then, daily, `Transactions_temp: LOAD * FROM Transactions.csv; Transactions_final: LOAD * FROM Transactions.qvd; CONCATENATE (Transactions_final) LOAD * FROM Transactions_temp WHERE NOT Exists(LoadDate); STORE * INTO Transactions.qvd;`

Answer & Explanation: The most robust approach for incremental loads is often a variation of option 3. The idea is to load the existing QVD, load the new data, and then combine them, ensuring no duplicates based on a key. A more refined approach might involve loading the QVD, then loading the new data into a temporary table, and then performing a `CONCATENATE` or `JOIN` after filtering. However, option 3 provides a good conceptual framework for incremental loading by using `Exists()`. Option 4 has a slight ordering issue and a less efficient `Exists` check.

3. User Interface and Object Configuration

Creating visually appealing and insightful dashboards is key. This section tests your knowledge of QlikView objects and how to configure them effectively.

Key Concepts:

1. **Chart Types:** Bar charts, line charts, pie charts, scatter plots, pivot tables, straight tables, KPIs, gauges – understanding their use cases.
2. **Expressions:** Aggregate functions (`Sum()`, `Count()`, `Avg()`, `Min()`, `Max()`), set analysis (`{SetExpression}`), conditional aggregation (`If(Condition, Expression)`).
3. **Dimensions and Measures:** How they are defined and used in charts.
4. **Triggers:** Automating actions based on user selections or events.
5. **Layout and Design:** Organizing objects, using skins, themes, and bookmarks for user experience.
6. **Variables:** Using variables for dynamic labels, expressions, and control flow.

Example Scenario:

You need to display the total sales amount for each product category. You want the chart to dynamically update the category name based on user selections and show only categories with total sales exceeding $10,000. Which QlikView object and configuration would be most appropriate?

1. A Straight Table with `Category` as the dimension and `Sum(SalesAmount)` as the measure, filtered by a List Box for Category.
2. A Bar Chart with `Category` as the dimension and `Sum(SalesAmount)` as the measure, with a `Count(Distinct ProductID)` in the drilldown dimension.
3. A Bar Chart with `Category` as the dimension and `Sum(SalesAmount)` as the measure, using Set Analysis in the expression to filter for sales greater than $10,000.
4. A KPI object showing `Sum(SalesAmount)` and a dimension of `Category`, with a threshold color for values above $10,000.

Answer & Explanation: The best answer is likely a combination of a **Bar Chart** or **Pivot Table** with appropriate expressions and filtering. Option 3 hints at using Set Analysis, which is powerful for filtering within expressions. A more practical solution for the scenario might be a Bar Chart with `Category` as dimension and `Sum(SalesAmount)` as measure. Then, you'd either use a KPI object with a condition or a separate filter within the chart properties (like an "Island" chart or a measure expression with an IF statement) to show only categories exceeding $10,000. However, among the given options, we need to pick the best fit. Let's refine: a Bar Chart with `Category` as Dimension and `Sum(SalesAmount)` as Measure is the base. To filter for *categories* whose *total sales* exceed $10,000, you'd typically do this either through a chart property filter or by creating a derived field/flag in the script. If we interpret the question as filtering the *display* of categories based on their total sales, then a Bar Chart with `Category` and `Sum(SalesAmount)` as measure, combined with a mechanism to filter out categories below the threshold (either through an advanced `IF` in the measure or a calculated dimension) would be key. Let's reconsider the options with this in mind. Option 3 suggests Set Analysis for filtering sales *greater than* $10,000. This would filter the sales *amount*, not necessarily the *categories* based on their total. A more direct approach for filtering *categories* would involve a calculated dimension or a flag. Given the options, let's assume a typical scenario: You want to see categories that *have* total sales over $10,000. A Bar Chart (`Category` dimension, `Sum(SalesAmount)` measure) combined with a filter pane or a calculated dimension that flags categories meeting the criteria would be ideal. Option 3 is close but doesn't perfectly address filtering the *categories* based on their aggregate sum. However, if the intent is to show sales *for* categories where the total is above 10k, then a combination is needed. Let's lean towards a visual representation. A **Bar Chart** with `Category` as the dimension and `Sum(SalesAmount)` as the measure is a good start. To filter out categories below $10,000, you would

typically use a `WHERE` clause in a **Calculated Dimension** or within the chart's properties if possible. Option 3's reference to Set Analysis is powerful for aggregating but filtering categories based on that aggregate might require a different approach. Let's assume the question implies filtering the *output* of the chart. In many cases, you'd add a filter to the chart properties or use a calculated dimension. If we interpret "filter for sales greater than $10,000" as applying to the *total sales of the category*, then a **Bar Chart** with `Category` as the dimension and an expression like `If(Sum(SalesAmount) > 10000, Sum(SalesAmount))` would achieve this, effectively hiding categories with low sales. Option 3's phrasing is a bit ambiguous regarding what "sales" it's referring to. A more straightforward approach for this specific requirement (displaying categories with total sales > $10,000) would often involve a calculated dimension or a filtered chart. Without seeing the specific context of the exam, it's tough to be definitive, but the core is understanding how to build and filter visualisations. Let's assume the most common interpretation: display categories and their sales, but only for those categories whose total sales exceed $10,000. This would require a filtering mechanism on the category level. Option 3 is the closest to suggesting a powerful filtering mechanism within the expression context.

Revised thought: A more accurate interpretation for the scenario: you want to show categories, and the sales *for* those categories, but *only if* the total sales for that category exceed $10,000. This is best achieved by using a calculated dimension or a conditional expression in the measure. For example, the measure could be `If(Sum(SalesAmount) > 10000, Sum(SalesAmount))`. This would show the sales amount for categories meeting the condition and NULL (or nothing) for those that don't. This would then implicitly filter out categories that don't meet the criteria when presented visually. Therefore, a **Bar Chart** with `Category` as dimension and an expression like `If(Sum(SalesAmount) > 10000, Sum(SalesAmount))` is a strong contender. Option 3, mentioning Set Analysis, is powerful but might be overkill or not the most direct for this specific filtering requirement unless the Set Analysis itself is constructed to achieve this. Let's go with the most direct approach to visual filtering.

Final Answer Rationale: For displaying *categories* whose *total sales* exceed $10,000, a Bar Chart with `Category` as the dimension and an expression like `If(Sum(SalesAmount) > 10000, Sum(SalesAmount))` in the measure is a common and effective method. This expression ensures that only sales for categories meeting the threshold are displayed. Option 3, mentioning Set Analysis, is powerful but might be more suited for complex aggregations. The scenario focuses on filtering the *categories* based on their aggregate sum. Therefore, a Bar Chart with a conditional expression in the measure is the most appropriate interpretation. However, since Set Analysis is a cornerstone of QlikView, and can be used to achieve such filtering, it's a plausible answer if the Set Analysis is structured correctly, e.g., `{} Sum(SalesAmount)`. Let's assume Option 3, referencing Set Analysis, is designed to encompass this functionality, making it a strong candidate for a QlikView certification question that tests advanced techniques.

4. Performance Tuning and Optimization

Slow QlikView applications can be frustrating for users. Understanding how to optimize data models and scripts for speed is crucial.

Key Concepts:

1. **Associative Model Optimization:** Minimizing the number of tables and fields, breaking circular references, using surrogate keys.
2. **QVD Performance:** The benefits of using QVDs for faster reloads.
3. **Script Optimization:** Using `WHERE` clauses, reducing `LOAD DISTINCT`, avoiding unnecessary joins, efficient use of variables.
4. **Chart Optimization:** Limiting the number of dimensions and measures, using aggregation effectively, avoiding complex calculations in chart expressions where possible.
5. **Document Properties:** Settings like `Maximum Number of Symbols in Field`.
6. **Memory Management:** Understanding how QlikView uses memory and how to optimize it.

Example Scenario:

Your QlikView application is experiencing slow reloads, especially when loading the main fact table which has millions of rows. What is the *most effective* first step to improve reload performance?

1. Reduce the number of dimensions in your charts.
2. Store the fact table in a QVD file and perform incremental loads.
3. Optimize the formulas in your KPI objects.
4. Increase the system's RAM.

Answer & Explanation: The most effective first step for slow reloads involving large fact tables is to implement **2. Store the fact table in a QVD file and perform incremental loads.** QVDs are designed for extremely fast data loading, and incremental loads ensure only new data is processed, drastically reducing reload times compared to hitting the source system every time.

5. Set Analysis

Set Analysis is a powerful feature in QlikView that allows you to perform calculations on specific sets of data, overriding the current selections. It's essential for advanced calculations and comparisons.

Key Concepts:

1. **Set Operators:** `Set_Expression` `Set_Operator` `Set_Expression`. Common operators include `+` (union), `-` (difference), `*` (intersection).
2. **Set Modifiers:** `(SetExpression)` which can contain field-value pairs or other set expressions.
3. **Implicit vs. Explicit Set Analysis:** Understanding how QlikView defaults to the current selection.
4. **`CALCULATE` Function:** For evaluating set expressions.
5. **The `$` Identifier:** Represents the current selection.
6. **`TOTAL` Keyword:** For aggregation across all dimensions.

Example Scenario:

You have a chart showing sales by month. You want to display the total sales for the current selection, and in a separate expression, show the total sales for the *same month last year*, regardless of the current selection. Which Set Analysis expression would you use for "total sales for the same month last year"?

1. `Sum({$ } SalesAmount)`
2. `Sum({$ } SalesAmount)`
3. `Sum({1 } SalesAmount)`
4. `Sum({1 } SalesAmount)`

Answer & Explanation: The correct answer is **1**. Let's break it down:

1. `{$ ... }`: Refers to the current selections in the data model.
2. ``: This part is incorrect because it attempts to set the year to "last year" which is not dynamic enough to guarantee it's the *same month* last year.
3. `Month = {"$(=Month(Today()-365))"}`: This expression dynamically calculates the month corresponding to 365 days ago (essentially the same month in the previous year, assuming no leap year complexities or specific date handling needs) and applies it as a filter to the `Month` field.
4. `Sum(SalesAmount)`: The aggregation function.

Option 2 tries to fix the year but doesn't dynamically account for the month. Options 3 and 4 use `1` (all data) and `peek`

which are not directly relevant to comparing with the previous year's same month relative to the current selection.

6. Debugging and Troubleshooting

When things go wrong, knowing how to find and fix the issues is a critical skill.

Key Concepts:

1. **Reload Log:** Interpreting error messages and warnings.
2. **Data Viewer:** Inspecting table structures, field values, and data types after loading.
3. **Script Debugger:** Stepping through script execution to identify where errors occur.
4. **Audit Trails:** Tracking user actions and data changes.
5. **Common Errors:** Synthetic keys, data type mismatches, incorrect field associations, syntax errors in scripts.

Example Scenario:

After running your QlikView script, you notice that a particular dimension in your application shows very few distinct values, and the associated measures are unexpectedly low. What is the *first* tool you should use to investigate this issue?

1. The Chart Inspector to examine the chart's expressions.
2. The Data Viewer to examine the loaded tables and fields.
3. The Script Debugger to step through the entire script.
4. The Deployment Wizard to check application configuration.

Answer & Explanation: The most logical first step is to use the **Data Viewer (Option 2)**. This tool allows you to directly inspect the data that has been loaded into each table and field. You can check the number of distinct values, look for nulls, data type issues, or unexpected values in the problematic dimension and related fact tables, which is key to diagnosing data loading or transformation errors.

The questions often cover a broad spectrum of topics, from fundamental principles to complex development techniques.

Key Areas Covered in QlikView Certification Exams

To effectively prepare for your QlikView certification exam, it's crucial to understand the core areas that are typically assessed. These include:

1. **Data Modeling and Scripting: This forms the backbone of any QlikView application. Questions will likely assess your ability to create efficient data models, write robust load scripts using**

QlikView's scripting language (QVD loading, incremental loads, transformations), handle data associations, and manage data hierarchies. Understanding star schemas and snowflake schemas is also vital.

2. **Front-End Development and User Interface (UI) Design: This area focuses on how users interact with QlikView applications. You'll be tested on your knowledge of creating effective dashboards, designing user-friendly layouts, utilizing various chart types (bar charts, line charts, pie charts, scatter plots, pivot tables), creating complex expressions using set analysis and aggregations, and implementing drill-down functionalities.**
3. **Set Analysis: A cornerstone of QlikView's powerful analytical capabilities, Set Analysis allows for complex calculations and comparisons. Expect questions on understanding Set Analysis syntax, applying modifiers, using aggregate functions, and creating dynamic expressions.**
4. **Expressions and Calculations: Proficiency in writing QlikView expressions is essential for creating dynamic charts, calculated dimensions, and calculated measures. This includes understanding aggregation functions (Sum, Count, Avg, Min, Max), conditional aggregation, and using variables.**
5. **Performance Optimization: Efficient QlikView applications are critical for a good user experience. You'll be tested on techniques for optimizing load scripts, improving chart performance, managing memory usage, and understanding the impact of data models on performance.**
6. **Security and Access Control: Implementing security measures to control user access to data and applications is a key responsibility. Questions may cover Section Access, row-level**

security, and user authentication.

7. **Deployment and Administration: While primarily focused on development, some questions might touch upon the deployment of QlikView applications and basic administrative tasks.**

Strategies for Mastering QlikView Certification Questions and Answers

Simply memorizing QlikView certification questions and answers is not a sustainable or effective strategy for true understanding and success. Instead, focus on building a solid conceptual foundation and practicing regularly. Here are some proven strategies:

1. Understand the Fundamentals Thoroughly

Before diving into specific exam questions, ensure you have a deep understanding of QlikView's core principles. This includes:

3. **Qlik Community Forums: The Qlik Community is a vibrant platform where users and experts share knowledge, ask questions, and discuss solutions. Engaging with this community can provide practical insights and help clarify complex concepts.**

3. Practice with Mock Exams and Sample Questions

Once you have a good grasp of the concepts, it's time to test your knowledge. There are various sources for QlikView certification questions and answers, including:

1. **Official Qlik Practice Exams: Qlik often provides official practice exams that closely mirror the format and difficulty of the actual certification test.**
2. **Third-Party Study Guides and Practice Tests: Numerous reputable websites and training providers offer comprehensive study materials, including question banks and simulated exams. Be discerning and choose resources that are updated and well-regarded.**
3. **Case Studies and Real-World Scenarios: Practice applying your knowledge to solve realistic business problems. Many certification questions are scenario-based, requiring you to interpret a problem and determine the best QlikView solution.**

When reviewing QlikView certification questions and answers from practice tests, don't just focus on getting the right answer. Understand *why* the correct answer is correct and *why* the other options are incorrect. This deeper analysis is crucial for long-term retention.

4. Focus on Practical Application

QlikView is a hands-on tool. The best way to learn is by doing. As you study QlikView certification questions and answers, simultaneously work on building your own QlikView applications. This practical experience will solidify your understanding of concepts and help you recall them during the exam.
